

# Chapter 4

## Network Layer

### A note on the use of these ppt slides:

We're making these slides freely available to all (faculty, students, readers). They're in PowerPoint form so you can add, modify, and delete slides (including this one) and slide content to suit your needs. They obviously represent a *lot* of work on our part. In return for use, we only ask the following:

- If you use these slides (e.g., in a class) in substantially unaltered form, that you mention their source (after all, we'd like people to use our book!)
- If you post any slides in substantially unaltered form on a www site, that you note that they are adapted from (or perhaps identical to) our slides, and note our copyright of this material.

Thanks and enjoy! JFK/KWR

# Chapter 4: Network Layer

## Chapter goals:

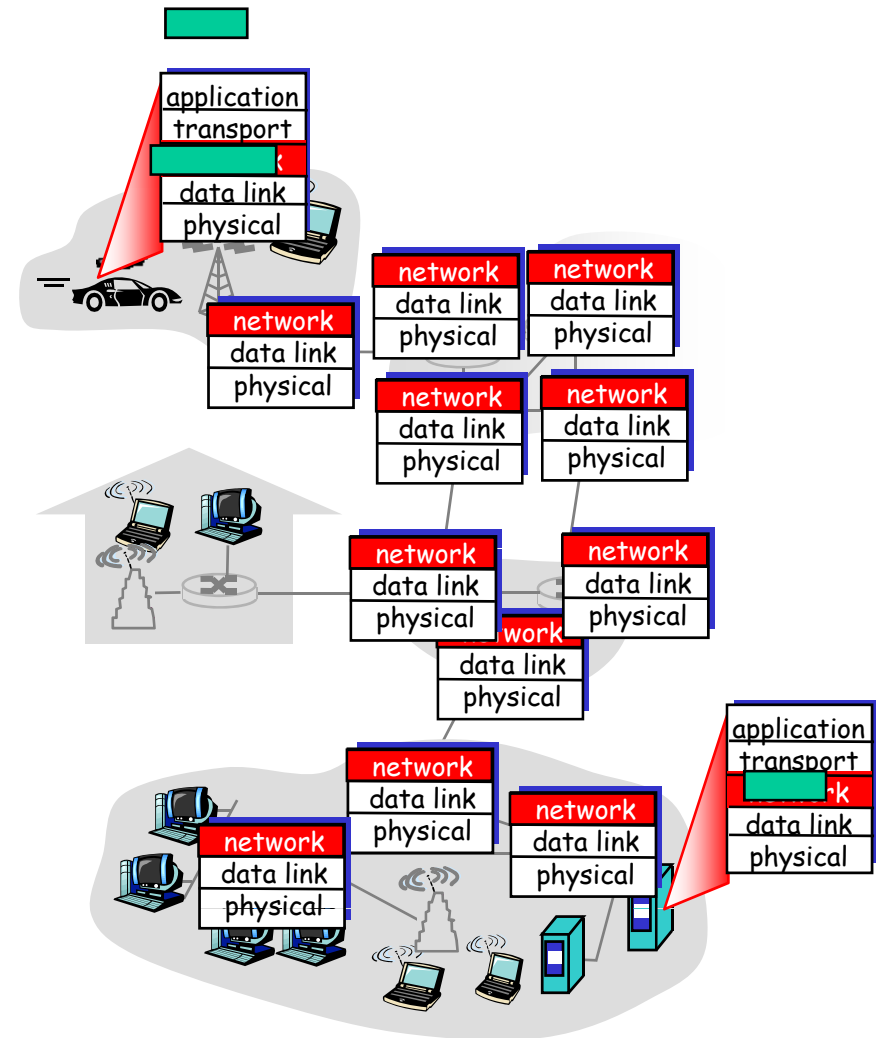

- ❑ understand principles behind network layer services:
  - network layer service models
  - forwarding versus routing
  - how a router works
  - routing (path selection)
  - dealing with scale
  - advanced topics: IPv6, mobility
- ❑ instantiation, implementation in the Internet

# Chapter 4: Network Layer

- ❑ 4.1 Introduction
- ❑ 4.2 Virtual circuit and datagram networks
- ❑ 4.3 What's inside a router
- ❑ 4.4 IP: Internet Protocol
  - Datagram format
  - IPv4 addressing
  - ICMP
  - IPv6
- ❑ 4.5 Routing algorithms
  - Link state
  - Distance Vector
  - Hierarchical routing
- ❑ 4.6 Routing in the Internet
  - RIP
  - OSPF
  - BGP
- ❑ 4.7 Broadcast and multicast routing

# Network layer

- ❑ transport segment from sending to receiving host
- ❑ on sending side encapsulates segments into datagrams
- ❑ on rcving side, delivers segments to transport layer
- ❑ network layer protocols in *every* host, router
- ❑ router examines header fields in all IP datagrams passing through it

# Two Key Network-Layer Functions

□ *forwarding*: move packets from router's input to appropriate router output

□ *routing*: determine route taken by packets from source to dest.

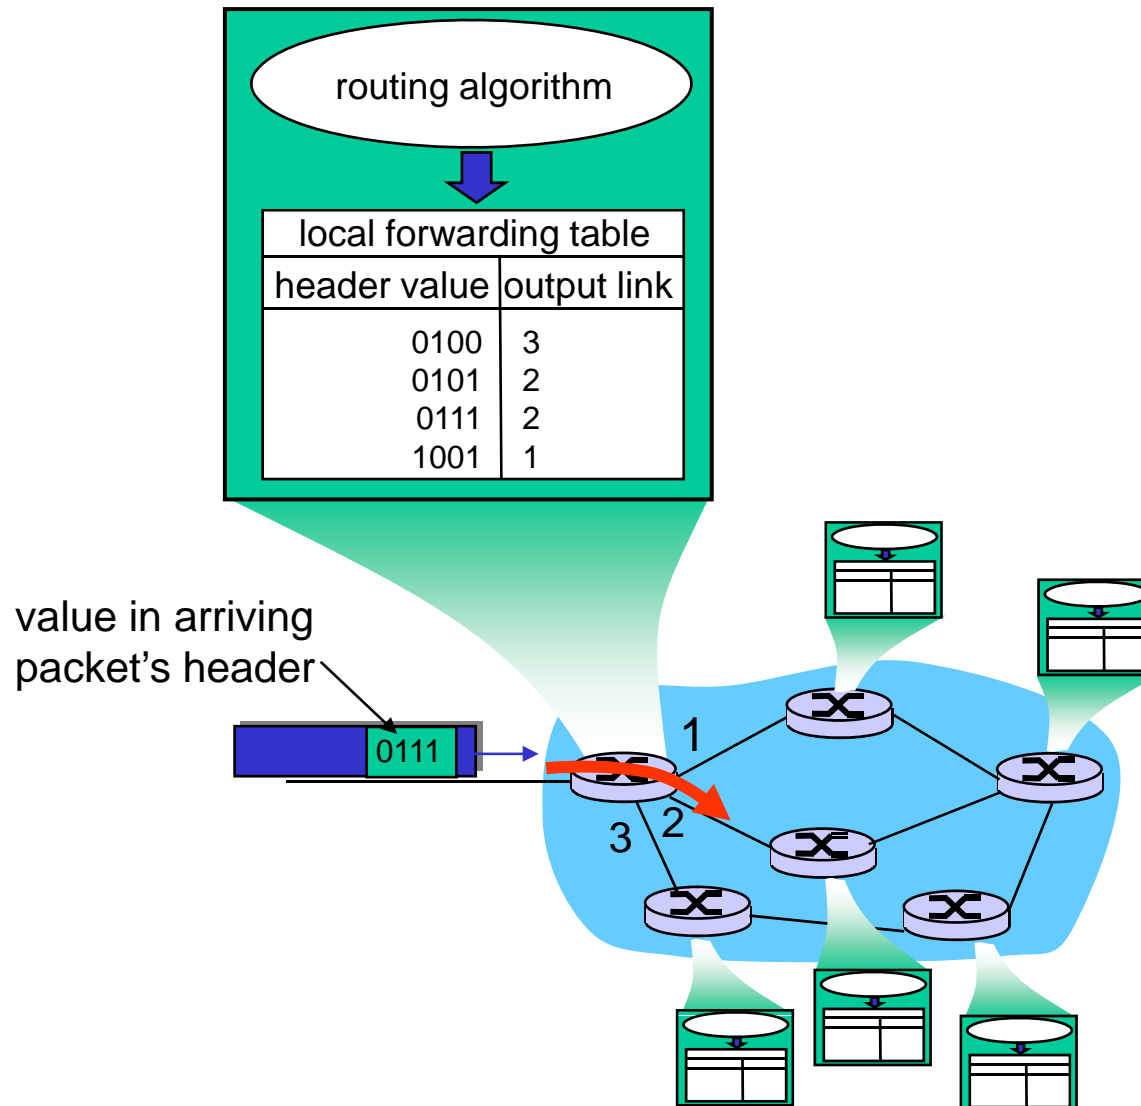

○ *routing algorithms*

analogy:

□ *routing*: process of planning trip from source to dest

□ *forwarding*: process of getting through single interchange

# Interplay between routing and forwarding

# Connection setup

- ❑ 3<sup>rd</sup> important function in *some* network architectures:
  - ATM, frame relay, X.25
- ❑ before datagrams flow, two end hosts *and* intervening routers establish virtual connection
  - routers get involved
- ❑ network vs transport layer connection service:
  - **network**: between two hosts (may also involve intervening routers in case of VCs)
  - **transport**: between two processes

# Network service model

Q: What *service model* for “channel” transporting datagrams from sender to receiver?

## Example services for individual datagrams:

- ❑ guaranteed delivery
- ❑ guaranteed delivery with less than 40 msec delay

## Example services for a flow of datagrams:

- ❑ in-order datagram delivery
- ❑ guaranteed minimum bandwidth to flow
- ❑ restrictions on changes in inter-packet spacing

# Network layer service models:

Network Architecture	Service Model	Guarantees ?			Congestion feedback	
		Bandwidth	Loss	Order Timing		
Internet	best effort	none	no	no	no (inferred via loss)	
ATM	CBR	constant rate	yes	yes	yes	no congestion
ATM	VBR	guaranteed rate	yes	yes	yes	no congestion
ATM	ABR	guaranteed minimum	no	yes	no	yes
ATM	UBR	none	no	yes	no	no

# Chapter 4: Network Layer

- ❑ 4.1 Introduction
- ❑ 4.2 Virtual circuit and datagram networks
- ❑ 4.3 What's inside a router
- ❑ 4.4 IP: Internet Protocol
  - Datagram format
  - IPv4 addressing
  - ICMP
  - IPv6
- ❑ 4.5 Routing algorithms
  - Link state
  - Distance Vector
  - Hierarchical routing
- ❑ 4.6 Routing in the Internet
  - RIP
  - OSPF
  - BGP
- ❑ 4.7 Broadcast and multicast routing

# Network layer connection and connection-less service

- ❑ datagram network provides network-layer connectionless service
- ❑ VC network provides network-layer connection service
- ❑ analogous to the transport-layer services, but:
  - **service:** host-to-host
  - **no choice:** network provides one or the other
  - **implementation:** in network core

# Virtual circuits

“source-to-dest path behaves much like telephone circuit”

- performance-wise
  - network actions along source-to-dest path
- 
- call setup, teardown for each call *before* data can flow
  - each packet carries VC identifier (not destination host address)
  - *every* router on source-dest path maintains “state” for each passing connection
  - link, router resources (bandwidth, buffers) may be *allocated* to VC (dedicated resources = predictable service)

# VC implementation

a VC consists of:

1. path from source to destination
  2. VC numbers, one number for each link along path
  3. entries in forwarding tables in routers along path
- packet belonging to VC carries VC number (rather than dest address)
  - VC number can be changed on each link.
    - New VC number comes from forwarding table

# Forwarding table

Forwarding table in northwest router:

Incoming interface	Incoming VC #	Outgoing interface	Outgoing VC #
1	12	3	22
2	63	1	18
3	7	2	17
1	97	3	87
...	...	...	...

**Routers maintain connection state information!**

# Virtual circuits: signaling protocols

- used to setup, maintain teardown VC
- used in ATM, frame-relay, X.25
- not used in today's Internet

# Datagram networks

- ❑ no call setup at network layer
- ❑ routers: no state about end-to-end connections
  - no network-level concept of "connection"
- ❑ packets forwarded using destination host address
  - packets between same source-dest pair may take different paths

# Forwarding table

4 billion  
possible entries

Destination Address Range

Which interface?

DA: 11001000 00010111 0001**1000** 10101010

Which interface?

# Datagram or VC network: why?

## Internet (datagram)

- ❑ data exchange among computers
  - "elastic" service, no strict timing req.
- ❑ "smart" end systems (computers)
  - can adapt, perform control, error recovery
  - simple inside network, complexity at "edge"
- ❑ many link types
  - different characteristics
  - uniform service difficult

## ATM (VC)

- ❑ evolved from telephony
- ❑ human conversation:
  - strict timing, reliability requirements
  - need for guaranteed service
- ❑ "dumb" end systems
  - telephones
  - complexity inside network

# Chapter 4: Network Layer

- ❑ 4.1 Introduction
- ❑ 4.2 Virtual circuit and datagram networks
- ❑ 4.3 What's inside a router
- ❑ 4.4 IP: Internet Protocol
  - Datagram format
  - IPv4 addressing
  - ICMP
  - IPv6
- ❑ 4.5 Routing algorithms
  - Link state
  - Distance Vector
  - Hierarchical routing
- ❑ 4.6 Routing in the Internet
  - RIP
  - OSPF
  - BGP
- ❑ 4.7 Broadcast and multicast routing

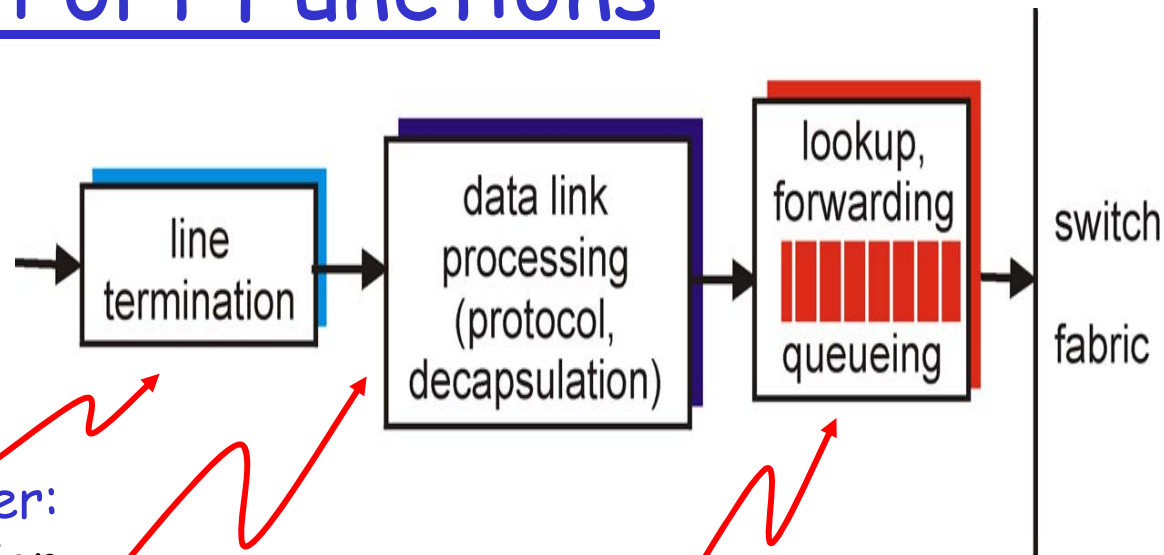

# Router Architecture Overview

Two key router functions:

- ❑ run routing algorithms/protocol (RIP, OSPF, BGP)
- ❑ *forwarding* datagrams from incoming to outgoing link

# Input Port Functions

Physical layer:  
bit-level reception

Data link layer:  
e.g., Ethernet  
see chapter 5

## Decentralized switching:

- given datagram dest., lookup output port using forwarding table in input port memory
- goal: complete input port processing at 'line speed'
- queuing: if datagrams arrive faster than forwarding rate into switch fabric

# Three types of switching fabrics

# Switching Via Memory

## First generation routers:

- ❑ traditional computers with switching under direct control of CPU
- ❑ packet copied to system's memory
- ❑ speed limited by memory bandwidth (2 bus crossings per datagram)

## Switching Via a Bus

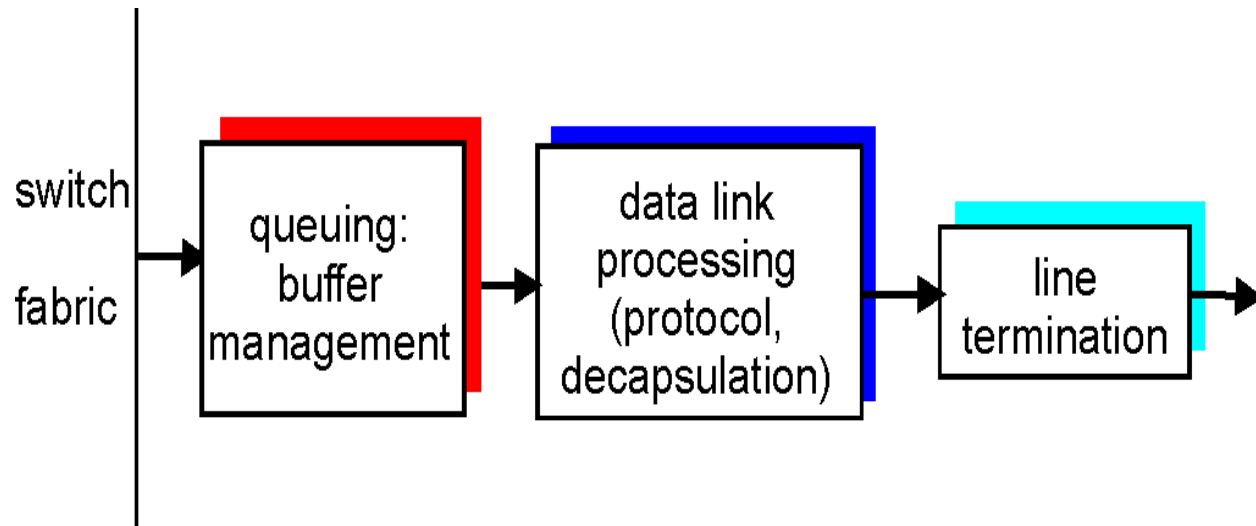

- ❑ datagram from input port memory to output port memory via a shared bus
- ❑ **bus contention:** switching speed limited by bus bandwidth
- ❑ 32 Gbps bus, Cisco 5600: sufficient speed for access and enterprise routers

# Switching Via An Interconnection Network

- ❑ overcome bus bandwidth limitations
- ❑ Banyan networks, other interconnection nets initially developed to connect processors in multiprocessor
- ❑ advanced design: fragmenting datagram into fixed length cells, switch cells through the fabric.
- ❑ Cisco 12000: switches 60 Gbps through the interconnection network

# Output Ports

- ❑ *Buffering* required when datagrams arrive from fabric faster than the transmission rate
- ❑ *Scheduling discipline* chooses among queued datagrams for transmission

# Output port queueing

- buffering when arrival rate via switch exceeds output line speed
- *queueing (delay) and loss due to output port buffer overflow!*

# How much buffering?

- RFC 3439 rule of thumb: average buffering equal to “typical” RTT (say 250 msec) times link capacity  $C$ 
  - e.g.,  $C = 10$  Gps link: 2.5 Gbit buffer
- Recent recommendation: with  $N$  flows, buffering equal to  $\frac{RTT \cdot C}{\sqrt{N}}$

# Input Port Queuing

- Fabric slower than input ports combined -> queueing may occur at input queues
- **Head-of-the-Line (HOL) blocking:** queued datagram at front of queue prevents others in queue from moving forward
- *queueing delay and loss due to input buffer overflow!*

output port contention  
at time t - only one red  
packet can be transferred

green packet  
experiences HOL blocking
